

Where Seeds Go To Chill.

With year-round farming redefining the supply and demand cycle for crop production, having seeds ready for all plantings requires complete protection from fluctuations in temperature and humidity.

As innovators in controlled humidity rooms and cold lockers, BMIL Technologies has your turnkey storage solution at a low capital investment and operating cost.

Featuring the patented Frio Verde refrigeration systems and **DZ-2000 Desiccant Dehumidifier** from BMIL, AgLocker introduces an ideal climate-controlled cold room that provides:

- **Refrigeration:** Consistent low temperatures, +20 to 50 degrees Fahrenheit.
- **Dehumidification:** Reliable low humidity conditions, 10 to 65 percent relative humidity.
- **Insulation:** Strong, lightweight urethane panels or urethane spray foam for fast unit installation and efficient temperature maintenance.
- **Controls:** Operator-friendly controls for easy monitoring of temperature and humidity.
- **Energy Efficiency:** Significant energy savings using half the power consumption of traditional refrigeration systems and desiccant dehumidifiers.

To be a key player in productive plantings and harvests, you can deliver seeds and agricultural products that keep cool when the heat is on.

Let BMIL turn your concepts into affordable reality to get your AgLocker up and running. Then nurture the seeds of success that bring new peaks of profit.
